

Laptop Specifics

Battery optimizations:

```
sudo pacman -S powertop tlp tlp-rdw
sudo powertop --auto-tune
sudo systemctl enable --now tlp.service
sudo systemctl mask systemd-rfkill.service systemd-rfkill.socket
```

Package Management

Pacman PGP fix

```
# refresh arch linux keyring
sudo pacman -S archlinux-keyring
# update system
sudo pacman -Syu
```

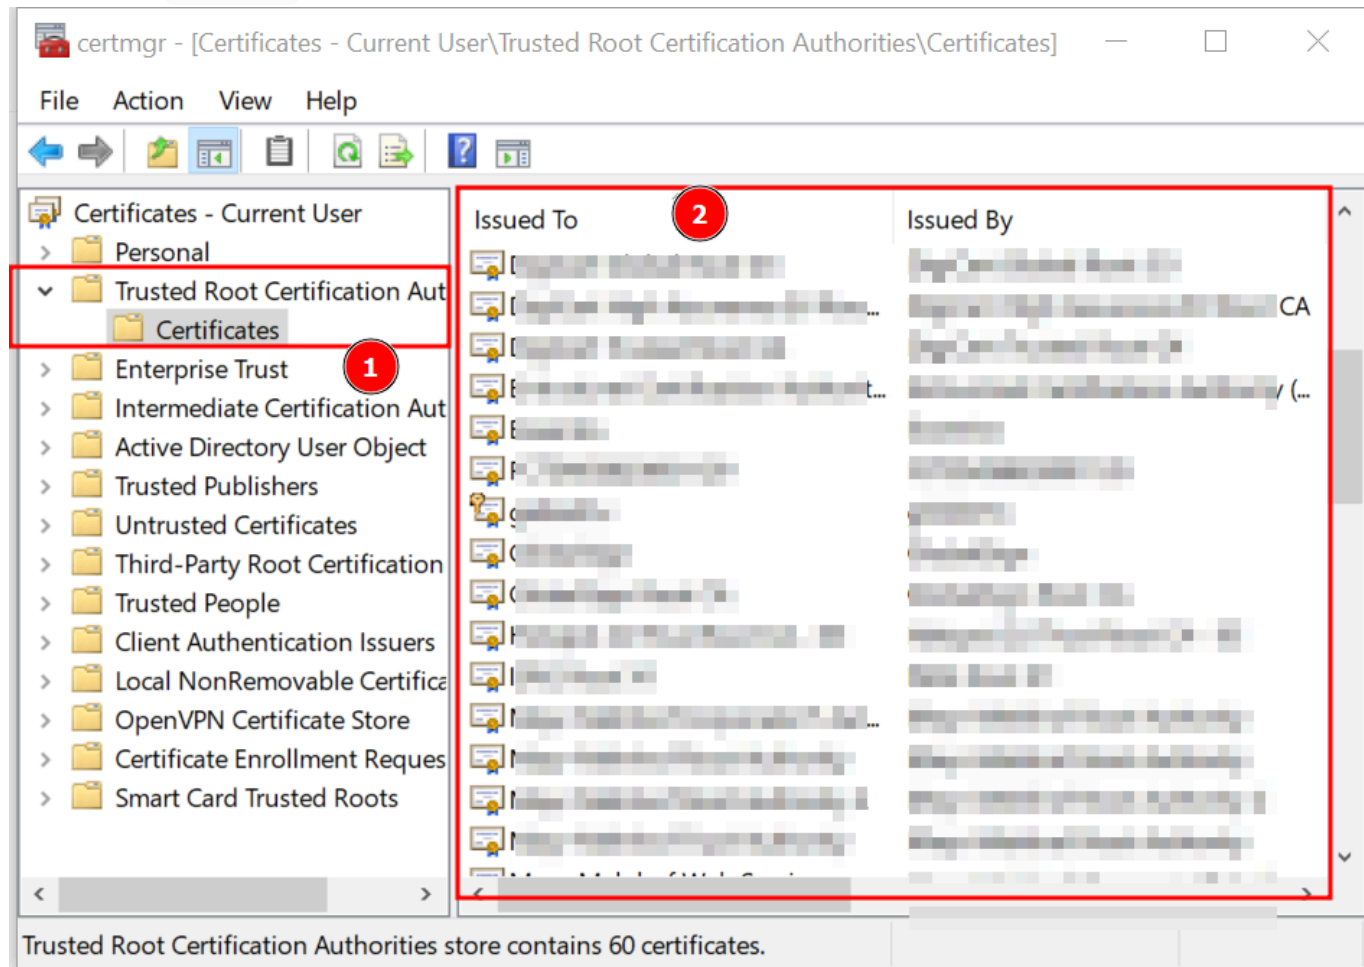

```
sudo pacman-key --init
sudo pacman-key --populate archlinux
sudo pacman-key --refresh-keys
```

Certificate

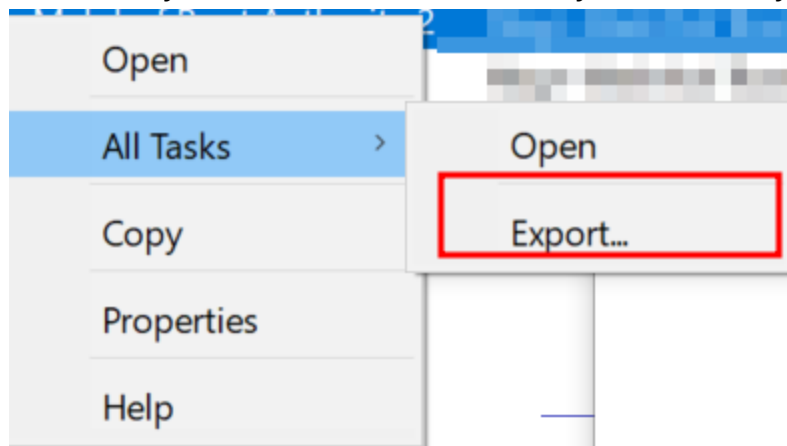

Make sure you have the `ca-certificates` package installed

Extract from windows

Search for certmgr that is the tool to list the certificates in windows

from there you can select the certificate you want and you can extract them

Make sure you select the following to be able to import it under linux

←  Certificate Export Wizard

Export File Format

Certificates can be exported in a variety of file formats.

Select the format you want to use:

- ☒ DER encoded binary X.509 (.CER)
- ☐ Base-64 encoded X.509 (.CER)
- ☐ Cryptographic Message Syntax Standard - PKCS #7 Certificates (.P7B)
 - ☐ Include all certificates in the certification path if possible
- ☐ Personal Information Exchange - PKCS #12 (.PFX)
 - ☐ Include all certificates in the certification path if possible
 - ☐ Delete the private key if the export is successful
 - ☐ Export all extended properties
 - ☐ Enable certificate privacy
- ☐ Microsoft Serialized Certificate Store (.SST)

Next

Cancel

Convert .der to .cer

```
openssl x509 -inform DER -in your_certificate.der -out your_certificate.cer
```

Add to trusted store

```
cp -r ./cert.cer /etc/ca-certificates/trust-source/anchors/  
sudo trust extract-compat
```

```
sudo update-ca-trust
```

Dumbass python version

Some old python tools will have unsuported `pkg_resources` like so:

```
#[p4p1@Typo3Scan untracked/]$ ./bin/python typo3scan.py -h
Traceback (most recent call last):
  File "/opt/pentest/Typo3Scan/typo3scan.py", line 31, in <module>
    from lib.domain import Domain
  File "/opt/pentest/Typo3Scan/lib/domain.py", line 28, in <module>
    from pkg_resources import parse_version
ModuleNotFoundError: No module named 'pkg_resources'
#[p4p1@Typo3Scan untracked/]$ ls
```

```
FROM python:3.10-slim
WORKDIR /app
RUN apt-get update && apt-get install -y git && rm -rf /var/lib/apt/lists/*
COPY . /app/
RUN pip install --no-cache-dir -r /app/requirements.txt
ENV PYTHONPATH="/app"
CMD ["/bin/bash"]
```

Run the container

```
sudo docker build -t pythontool .
sudo docker run --network host --rm pythontool -it
```
